

Both the 3 series version (IFTTT v1.2) and 2 Series (IFTTT 2 Series v1) IFTTT interface modules provides for communication with ifttt.com (if-this-then-that). With these modules you can, for example, control your Crestron system using voice commands on an Amazon Echo or pass data back from an IoT device connected to IFTTT. The 3 series version additionally allows you to send triggers to IFTTT so you can, for example, send emails or text messages based on events occurring in the Crestron system or control a wealth of IoT devices

An example program demonstrating both modules use and a detailed help file are provided.

These modules are each released as shareware. As a developer you can freely use either module on your own personal Crestron system. However, if you decide to use them on customer systems where you, or the dealer/csp you work for will profit from them than I ask for a single payment of \$100 for use of the 2 series version and a separate payment of \$100 for use of the 3 series version

What you get is

1. My thanks
2. Permission to use the module you paid for on as many client projects as you want
3. A copy of the full source code for the module you paid for. Only the Simpl# binary is included with the 3 series version and the 2 series Simpl+ code is encrypted
4. Good Karma

You can contact me at [jay.m.basen@gmail.com](mailto:jay.m.basen@gmail.com) to arrange for payment.

Thanks

Jay Basen
